### Graphs Of Sine And Cosine

Cosine is just like Sine, but it starts at 1 and heads down until  $\pi$  radians ( $180^\circ$ ) and then heads up again. Plot of Sine and Cosine In fact Sine and Cosine are like good friends : they follow each other, exactly  $\pi/2$  radians ( $90^\circ$ ) apart.

For a sine or cosine graph, simply go from 0 to  $2\pi$  on the x-axis, and -1 to 1 on the y-axis, intersecting at the origin (0, 0). Both  $y = \sin x$  and  $y = \cos x$  repeat the same shape from negative infinity to positive infinity on the x-axis (you'll generally only graph a portion of it).

Sine and Cosine - Desmos

The basic sine and cosine functions have a period of  $2\pi$ . The function  $\sin x$  is odd, so its graph is symmetric about the origin. The function  $\cos x$  is even, so its graph is symmetric about the y-axis. The graph of a sinusoidal function has the same general shape as a sine or cosine function.

Graphs of the Sine and Cosine Function | Precalculus

Next, plot these values and obtain the basic graphs of the sine and cosine function (Figure 1). Figure 1 One period of the a) sine function and b) cosine function. The sine function and the cosine function have periods of  $2\pi$ ; therefore, the patterns illustrated in Figure are repeated to the left and right continuously (Figure 2).

The sine and cosine graphs are almost identical, except the cosine curve starts at  $y = 1$  when  $t = 0$  (whereas the sine curve starts at  $y = 0$ ).

The graph of the cosine is the darker curve; note how it's shifted to the left of the sine curve. The graphs of  $y = \sin x$  and  $y = \cos x$  on the same axes. The graphs of the sine and cosine functions illustrate a property that exists for several pairings of the different trig functions.

Trigonometry - The graphs of sin and cos - YouTube

The sine and cosine functions have several distinct characteristics: They are periodic functions with a period of  $2\pi$ . The domain of each function is all real numbers and the range is  $[-1, 1]$ . The graph of  $y = \sin(x)$  is symmetric about the origin, because it is an odd function.

Graphs of the Sine and Cosine Functions □ Algebra and ...

The graph of  $y = \sin(x)$  is like a wave that forever oscillates between -1 and 1, in a shape that repeats itself every  $2\pi$  units. Specifically, this means that the domain of  $\sin(x)$  is all real numbers, and the range is  $[-1, 1]$ . See how we find the graph of  $y = \sin(x)$  using the unit-circle definition of  $\sin(x)$ .

Both of these graphs repeat every 360 degrees, and the cosine graph is essentially a transformation of the sin graph - it's been translated along the x-axis by 90 degrees. Thinking about the fact that  $\sin x = \cos(90 - x)$  and  $\cos x = \sin(90 - x)$ , it makes pretty good sense that they're 90 degrees out of phase.

### Trigonometry - Graphing the Sine, Cosine and Tangent ...

So to do this, I've set up a little chart for theta, cosine theta, and sine theta, and we can use this to, and the unit circle, to hopefully quickly graph what the graphs of  $y = \sin \theta$  and  $y = \cos \theta$  are and then we can think about how many times they intersect and maybe where they actually intersect. So let's get started.

### Intersection points of $y = \sin(x)$ and $y = \cos(x)$ (video ...

First, note that the sine and cosine graphs are the same shape - cosine is the same as sine, just slid 90 degrees to the left. Also, notice that their simple wave shape goes as high as 1 and as low as -1, and goes on forever to the left and right, repeating every 360 degrees. That's the period of both functions, 360 degrees.

### How to Graph Sine, Cosine, and Tangent - dummies

Graph of cosine function is drawn just like the graph of sine value, the only difference are the zeros. Take a look at a unit circle again. Where is the cosine value equal to zero? It is equal to zero where y-axis cuts the circle, that means in  $[\frac{\pi}{2}, \frac{3\pi}{2}]$
