Glycation creates disruptions in cellular function and structures and thereby drives higher level dysfunctions in the tissues and organs. It is a very significant element of serious chronic disease development and the aging process itself. It therefore is a strong factor affecting our longevity.

**Scourge of the AGEs: Glycation and Diabetes, Cancer, Heart ...**

AGEs and glycation are ultimately harmful to the body. As these AGEs flow through the body, they tend to stick in areas that they are not supposed to, including small capillaries. An easy way to think of glycation and AGEs is to compare them to a real life example. Picture your blood and capillaries as a car and AGEs as salt and rust.

Summary: AGEs (advanced glycation end-products) are in the spotlight again as geroscientists implicate this toxic waste of our bodies in a multitude of health conditions, including  inflammaging, cancer, and diabetes. Some scientists go as far as to link AGEs to an increase in the chronic inflammation which leads to heart attacks.

What do Advanced Glycation End Products (AGE) have to do with aging? Recent studies have revealed that Advanced Glycation End Products (shorted to AGE), do have a significant effect on the aging process.It can be difficult to pinpoint what does affect aging and what does not, as aging is usually the result of a combination of factors having to do with an individual's genetics and the ...

Scientists in the early '90s predicted cancer treatment would by now be advanced enough to contain the disease. Instead, two decades later, the disease has steadily climbed to become what Kenya Network of Cancer Organizations chairperson David Makumi calls "the plague of the 21st century".

Endogenous glycation, which occurs in the body, is associated with increased oxidative damage. AGEs and their by-products are linked to many age-related diseases, including Alzheimer's. This process is of particular concern for diabetics, who already suffer from the effects of poor glucose control.

**What is Glycation? (with pictures)**

Glycation is a natural process in which the sugar in your bloodstream attaches to proteins, forming harmful new molecules called advanced glycation end products (ironically, AGEs for short). Researchers are currently trying to figure out just how glycation factors into the age equation; it's not necessarily accurate...

Glycation can be driven by the metabolism of protein, carbohydrate, and fat. Insulin protects against glycation from all three sources, and insulin signaling is strongest after eating carbohydrate. In fact, glycation may actually serve important physiological roles under conditions of low insulin signaling, so it is important not to view it as an intrinsically "bad" process.

Glycation. Glycation (sometimes called non-enzymatic glycosylation) is the result of the covalent bonding of a sugar molecule, such as glucose or fructose, to a protein or lipid molecule, without the controlling action of an enzyme. Glycation may occur either inside the body (endogenous glycation) or outside the body (exogenous glycation).

**Glycation - Wikipedia**

Glycation: the concept. Glycated collagen accumulates at a rate of 3.7% yearly, 4 a percentage that will vary according to diet. Ultraviolet exposure also increases cross-linking in the skin, 5, 6 and cross-links of the proteins of antioxidant enzymes further decrease our natural defenses against free radicals.

The advanced glycation endproduct (AGE) undergoes glycooxidation, a process that is accelerated by the presence of free radicals. This is the super-dangerous part: Through glycooxidation, AGEs cross-link into a second, neighboring protein.
