The shock pulse meter counts the rate of occurrence (incoming shock pulses per second) and varies the measuring threshold until two amplitude levels are determined: The shock carpet level (approx. 200 incoming shocks per second). This level is displayed as dBc (decibel carpet value). The maximum level (greatest incoming shock under 2 seconds).

Shock Pulse Monitoring A Snapshot. Unless an individual is involved with some form of machinery vibration analysis, the term "Shock Pulse" (Monitoring) is unknown and somewhat foreign. Officially, and accurately, it is a technology relying on the physical principle that sound travels undiminished through metal objects for great distances.

Shock Pulse Monitoring — Process & Power
A shock pulse meter is very sensitive to detecting any defects in the bearing, but can't analyze the vibration created after the initial shock pulse. A SPM instrument can be used after about 1-2 days training and is more sensitive to bearing defects than the vibration pen.
